

Electrical Engineering, Industrial Production and the Future of IEEE

Stanimir VALTCHEV, Prof.
Portugal, Universidade Nova de Lisboa

We continue to live with the current pandemic situation, with all the uncertainty of our future. The industry depends on our working force and financing... Is the financing done in the same manner as before the 1970s? No, this is the problem! Our society changed the rules of functioning. The only way out is to make the industry to go on and as fast as possible! The production will save the world! What we need for an extensive and economically profitable production? The capitalism goes wrong direction says Noam Chomsky from MIT and he points the aim: we need a productive capitalism, and productive engineers. The universities must be closer to the real world, not to be monasteries. For that we need an international-wide organization and fortunately, we have it : the IEEE, which we need to use.
